Water Monitoring and Information

2010

**GROUNDWATER
WATER LEVEL NETWORK**

JUNE 2010

PURPOSE

This document details the Groundwater Water Level Network that is required to be monitored and maintained to meet the department's and State's groundwater management objectives.

The defined network identifies those bores required by the Department of Environment and Resource Management (DERM) that will enable the assessment and management of the groundwater resource to achieve sustainable ecological outcomes. It is acknowledged there is a need to link groundwater and surfacewater through the Water Resource Planning processes. The majority of the information used to assist planners in this area has come from the operation and maintenance of this network over past decades. The information collected ensures there is a minimum dataset on which to base decisions so as to provide for resource sharing and ecologically sustainable outcomes.

IMPLEMENTATION

The Water and Ecological Monitoring Co-ordination Team (WEMCT) oversees the program development and implementation to ensure State conformity. The General Manager Water Quality & Accounting is responsible for preparing the network program, which is endorsed by the Water Business Strategy Group.

Regional Service Directors are responsible for the delivery of the program outlined in this document. Suitably qualified regional staff are required to obtain water levels only at sites referenced in this document and at the frequencies outlined. The mandatory work to service and maintain the network is to be conducted in accordance with the work practices and operational procedures as approved by the General Manager Water Quality & Accounting, the Data Custodian. This is part of department's (ISO9001) accreditation for monitoring and information management.

GENERAL INFORMATION

DERM is responsible for the management of Queensland's groundwater resources, its protection and sustainable use. The Groundwater Water Level Network consists of around 5 500 groundwater bores and fulfils a Departmental obligation under the *Water Act 2000*. The collected data is used for water resource planning and water management programs and is available to the public, water service providers, local governments and community groups.

The existing network, established in 2004 has been reviewed using Multi-Criteria Analysis (MCA). The steps adopted for reviewing the ground water monitoring network were as follows:

1. Review the existing network, identify new bores drilled since last review and analyse the facilities status.
2. Rank the existing network taking into consideration the following elements:
 - identify key bores using frequency of use of the data,
 - assess recorded water level fluctuation,

- identify bores according to their managed area,
 - prioritise bores by the number of data collection types,
 - identify external factors,
 - assess the distance to the nearest bore,
 - mark bores representative of the aquifer,
 - assess bore condition and access to the site.
3. Design the network and establish monitoring schedules.
 4. Align the review network to monitoring requirements and availability of resources.
 5. Identify bores requiring replacement.
 6. Conduct the gap analysis to identify deficiencies in the existing network.
 7. Identify bores where either short or long term monitoring technology is required.

DESCRIPTION OF THE DATA TABLE

This document contains the current list of the bores identified on the Groundwater Water Level Network for measuring water levels and salinity from sea water intrusion processes.

The table contains the list of the monitoring bores sorted by sub-basin and registered number and contains the following information:

- RN – Registered number,
- Pipe – Pipe symbol (for multiple aquifer monitoring),
- Sub-basin – sub-basin location of the bore,
- Office – Office responsible for conducting measurements,
- Drilled Date – the drilled date of the bore,
- Facility Status – EX – Existing; AU – Abandoned but still useable; AD – Abandoned and Destroyed,
- Latitude – location, and Longitude – location,
- Water Level Monitoring Frequency – minimum annual monitoring requirements,
- Sea water Intrusion – Bores measured against seawater influence,
- Sea water Intrusion Frequency – frequency of measurements for bores identified as influenced by sea water,

The Groundwater Water Level Network will be reviewed annually and in accordance with the approved methodology. This will include network integrity, scientific analysis of data, risk governance framework and integrity of bores.
